

Experiment	Inefficient baseline	Oracle / ideal	Selected workflow	Takeaway
Symbol medium	naive select 33,871 tok 181.191s	bundle oracle 305 tok 2.600s	filtered bundle 824 tok 6.262s	Oracle is fastest; filtered selector adds planning cost but stays far below naive select.
Symbol hard	naive select 33,922 tok 172.170s	bundle oracle 369 tok 3.475s	filtered bundle 587 tok 5.404s	Bundle solves context size; remaining errors come from execution reasoning.
Source medium	full_source 120,208 tok 22.117s	pointer oracle 286 tok 2.443s	pointer select 780 tok 6.423s	Pointer extraction separates disk data size from prompt size.
Runtime medium	full_runtime 131,136 tok 26.270s	runtime oracle 311 tok 2.610s	runtime select 757 tok 6.891s	Tool output remains session-local instead of becoming message history baggage.

How to read this table
Oracle rows skip selection and should be faster than selected workflows.

Core conclusion
Selected workflows add overhead, but remain far below full or naive context.
